ABSTRACTED-PUB-NO: JP06297565A  
 BASIC-ABSTRACT:

The cover film comprises a polyester film having a surface wet force of below 36 dyne/cm. The polyester film has a Young's modulus of 10-25 kg/sq.mm.

The polyester film has a haze above 10%, and an at least 1 micron roughness density PC-1 of 10 and more/mm (JIS -B- 0601-1976). The polyester is (a) a polyester contg. at least 5-50 mol.% of long-chain aliphatic dicarboxylic acid and/or cyclohexane dicarboxylic acid having an at least 10C alkylene gp., (b) a polyester contg. polycaprolactone black copolymerised, (c) a polyester contg. polyethylene glycol black copolymerised and/or (d) a polyester contg. polytetramethylene glycol black copolymerised. The cover film contains a layer contg. 1-50 wt.% of a non-crystalline polyolefin (pref. a norbornene type resin), on one or opposite sides of the polyester film.

USE/ADVANTAGE - The film is useful as a cover film for photoresists, and has superior high flatness with fewer irregularities, gels, and fish eyes. It has good flexibility and release properties. The roughened surface prevents air from being trapped when the film is pressed with rolls for sticking, and also prevents a photoresist from being self-crosslinked, due to the air-circulation properties of the wound roll of film.

ABSTRACTED-PUB-NO: JP06328541A

BASIC-ABSTRACT:

Saponified ethylene - vinyl ester copolymer (A) and a polyolefin resin (B) (e.g., polyethylene type) with adhesive properties are co-extrusion coated onto a base e.g. PE, PP. The copolymer has pyrolytic behaviours expressed by the following characteristics (P value) of 45 seconds to 15 mins.

A melt indexer comprising a nozzle with an inside dia. of 2 mm phi and a length of 1 cm. and a cylinder with an inside dia. of 9.5 mm phi is heated at 300 deg.C. Into the cylinder, 5 g. of a sample resin is placed, and immediately a load of 2.16 g. is applied, so that 1 g. of the resin is discharged through the nozzle. Then, the load is removed. The nozzle is sealed. A load of 480 g. is applied. The time required till the piston is elevated 5 mm., from the start of the loading of 480 g. is defined as P value.

The multi-layer structure is so laminated that the base material has an adhesive resin layer, and the layer (B) is adjacent to the adhesive resin layer side of the base material.

USE/ADVANTAGE - Structure is useful as a film for foods, pharmaceuticals, industrial chemicals, cosmetics, etc. Voids are eliminated from the film even if the film is extrusion-moulded at a high speed.

## BASIC-ABSTRACT:

Appts. comprises exhaust mechanism for reducing the press.; a set of feed rolls for the substrate; a set of press rolls for adhering the film to form a laminated plate; and a set of rolls for removing the laminated plate from the appts. Feed rolls and removing rolls are covered with rubber lining.

Appts. is used for adhering polyester film or photo-sensitige film material to copper-coated laminates or printed circuits.

ABSTRACTED-PUB-NO: JP03012402A

## BASIC-ABSTRACT:

Photosensitive resin laminates are produced by coating releasable film-like articles (1) having a smooth surface with photosensitive resin solns. (2), drying the coat face and forming a photosensitive resin layer (3), laminating (3) with support films (4). (1) is e.g. polyethylene terephthalate (PET) film, polyethylene film and mould release paper. (4) is PET film, polypropylene film. (2) are solns. prepd. by dissolving binders e.g. methyl (meth)acrylate (MMA) (co)polymer, MMA-(meth)acrylic acid copolymer, alpha,beta-unsatd. ethylene gp.-contg. photopolymerisable monomers, photopolymerisation initiators in solvents.

USE/ADVANTAGE - Used for the mfr. of printed wiring boards. Since the photosensitive resin layer coated with a releasable film is smooth, it adheres to base boards for printed wiring boards without including air. Then, circuits are formed on the base boards without breaking minute resist lines.

In an example, a photosensitive resin soln. was prepd. from 50 pts.wt. of methyl methacrylate-n-butyl methacrylate-methacrylic acid copolymer, 15 pts.wt. of trimethylolpropane triacrylate, 15 pts.wt. of tetraethylene glycol diacrylate, 2 pts.wt. of 2,4-diethylthioxanthone, 2 pts.wt. of ethyl p-dimethylaminobenzoate, 0.05 pts.wt. of Malachite Green, 0.1 pt.wt. of p-methoxyphenol and 200 pts.wt. of MEK. Smooth PET film was coated with the resin soln., dried with a hot draft held at 80 deg.C for 10 mins. The 50 micron thick photosensitive resin layer was adhered to a 20 micron thick PET film. A photosensitive resin laminate was obtd.

ABSTRACTED-PUB-NO: JP07286008A  
BASIC-ABSTRACT:

A propylene polymer contains (a) below 10 g of solid material other than propylene (max. particle size above 10  $\mu$ m), and (b) below 1 g of solid material other than polypropylene (max. particle size above 100  $\mu$ m).

Also claimed is a propylene polymer contg. (a) 98.0-100 mole% of propylene units and (b) 2-0 mole% of alpha-olefin (except for ethylene and propylene) unit(s).

Also claimed is prodn. of the propylene polymer comprising (1) producing propylene polymer of above 30000 g (based on 1 g atom of Ti in a polymerisation catalyst) and (2) eliminating the olefin polymerisation catalyst.

Also claimed is prodn. of the propylene polymer in presence of a Ti catalyst supported with a carrier.

USE - The polymer gives bi-stretched film with reduced voids and improved smooth surface. The film is used for laminating materials.

ADVANTAGE - The propylene polymer has reduced larger polymer particles.

ABSTRACTED-PUB-NO: JP06083066A  
 BASIC-ABSTRACT:

The cover film consists of rough surface layer (B layer) on at least one side surface of the biaxially oriented polyolefin film (A layer). The roughness density (PCI) of the rough surface layer (1 microns or more) is 10/mm or more, and the birefringence of the film is 0.002-0.010, and the total haze is 10% or more, and gel and fish eyes are 5/100 mm<sup>2</sup> or less. The biaxially oriented polyolefin film (A layer) consists of at least one resin of ethylene-propylene copolymer, ethylene-propylene-butene copolymer, and propylene-butene copolymer. The rough surface layer (B-layer) consists of a mixt. of LDPE or LLDPE, and ethylene-propylene block copolymer.

USE/ADVANTAGE - Provides the cover film with suitable adhesion characteristics and delamination characteristics to the resist.

In an example, a layer of ethylene-propylene-butene copolymer 75 wt.% and LLDPE 25 wt.% mixt. was supplied to a first extruder. B-layer: LLDPE 75 wt.% and ethylene propylene block copolymer mixt. was supplied to a second extruder. And then the co-extruded film of B/A/B was produced, and biaxially oriented.

AB	The cover film is prepd. by laminating a rough surface layer with d. of roughness of .gtoreq.1 .mu.m (PC1) .gtoreq.10 nos./mm on .gtoreq.1 side of				
	a biaxially-drawn polyolefin film and has a double refractive index of 0.002-0.010, a total haze of .gtoreq.10%, and .ltoreq.5 nos./100 mm2 gels or <b>fish eyes</b> . The cover film shows little unevenness in thickness, good flexibility, and improved peelability from <b>photoresists</b> . Thus, a compn. contg. ethylene-propylene-butene copolymer and low d. polyethylene (for the polyolefin film) and ethylene-propylene block copolymer (for the layer) were co-extruded, and the laminate was biaxially drawn to give a cover film (PC1 58 nos./100 mm2; total haze 45%; gel and <b>fish eye</b> <u>1/100 mm2</u> ).
